

# **Results from an Assessment of the National Weather Service's Storm Data Loss Estimation Methodology**

**Emily K. Laidlaw, Jeffrey K. Lazo, Nathaniel F. Bushek**  
**Societal Impacts Program**  
**National Center for Atmospheric Research**  
<http://www.sip.ucar.edu>  
[laidlaw@ucar.edu](mailto:laidlaw@ucar.edu)

**May 5, 2010**

**2nd NOAA Testbed Workshop**  
**Boulder, CO**

# Motivation

- Extreme Weather Sourcebook
  - Reliability and validity of data
  - Most data from Storm Data
- Not much information on Storm Data generation outside of NWS
- Storm Data and other damage data used to:
  - Examine trends in intensity and frequency of impacts
  - Ensure cost effectiveness of government-funded efforts
  - Resource for media & public
- Used without consideration of data quality issues
- Storm Data represents best infrastructure for a national monetary damage database

The screenshot shows the 'Extreme Weather Sourcebook' website. The header includes navigation links: Home, Hurricanes, Floods, Tornadoes, U.S. Composite, Lightning, and Other. Below the header, a welcome message states: 'Welcome to the Extreme Weather Sourcebook. Economic & Other Societal Impacts Related to Hurricanes, Floods, Tornadoes, Lightning, & Other Weather Phenomena.' It also mentions 'Hurricanes 1900 - 2006 (Sources)' and provides a paragraph about hurricane damage. Two tables are displayed: 'By Rank' and 'Alphabetical', both showing 'Total Normalized Damage (millions 1999 US\$)' for various states.

State	Rank	Total Normalized Damage (millions 1999 US\$)
U.S. Hurricane Damage excluding Hawaii and Puerto Rico		\$600,895
Florida	1	\$271,666
Texas	2	\$106,829
Louisiana	3	\$66,950
North Carolina	4	\$34,516
Mississippi	5	\$30,765
New York	6	\$18,534

State	Rank	Total Normalized Damage (millions 1999 US\$)
U.S. Hurricane Damage excluding Hawaii and Puerto Rico		\$600,895
Alabama	9	\$13,191
Connecticut	8	\$16,430
Delaware	19	\$31.0
Florida	1	\$271,666
Georgia	13	\$1,411
Louisiana	3	\$66,950

# Goals of the Project

## What we wanted to do

- Increase understanding of the process of making Storm Data monetary loss estimates
- Provide feedback to NWS to help improve Storm Data motivation and training
- Ultimately increase the consistency and quality of the data being entered in Storm Data

## What we didn't want to do

- Pretend to be experts
- Undermine the hard work that goes into creating Storm Data
- Create more work for those entering Storm Data

# Our Research – Overview & Methods

- **Surveyed NWS personnel who generate Storm Data**
- **Worked with NWS Performance Branch**
- **Focused on events, not episodes**
- **Two part survey**
  - Part A – Surveyed 122 Weather Forecast Offices (WFO) + Amer. Samoa
    - **WCM gathered collective responses for WFO**
    - **Focused on how Storm Data process works at WFO**
    - **81% response rate (100 WFO)**
  - Part B - Quantitative survey of 647 events (out of 72,835) 8/07 – 7/08
    - **Survey sent to NWS employee who created data for particular event**
    - **Focused on how data was generated and recorded for specific event**
    - **41% response rate**
- **Pretested by NWS and societal impacts researchers**
- **Controlled access through external survey company**

# Perceptions of Accuracy

## Conditions when estimating \$0 or no info for losses

Response	\$0	No Info
You suspected there were monetary losses but did not have the . . .		
. . . time	0%	31%
. . . information	23%	79%
. . . training or technical skill	12%	28%

# Perceptions of Accuracy

- **81% of WFOs – insufficient access to needed information sometimes prevents them from making reliable loss estimates**
- **69% of WFOs – recorded “no information available” for loss estimate at least “sometimes” in the past year even though they knew or suspected there were monetary losses**
  - **56% said insufficient information caused them to enter “no information available” for Part B event**
  - **21% expressed confidence for Part B estimate when entering no info.**
- **52% of WFOs – recorded \$0 for loss estimate at least “sometimes” in the past year even though they knew or suspected there were monetary losses**
  - **48% said insufficient information caused them to enter “\$0” for Part B event**
  - **53% expressed some confidence for Part B estimate when entering \$0**

# Types of impacts Included in loss estimates

# Training/Resources

- **36% of respondents reported that their WFO had received no formal training in estimating monetary losses**
- **Yet 87% of respondents said it was “very important” or “extremely important” that all WFOs use a similar methodology to estimate Storm Data monetary losses**

## Most Common Lost Estimate Training Sources

# Additional Resources

## Mean Usefulness of Additional Resources

# NWS Changes as a Result of Storm Data work

- Developing standardized software (summer 2010) to create more consistent and accurate loss estimates
  - Improve metadata
  - Improve use of data
- Creating new training modules
  - Using articulate presenter technology that combines PowerPoint slides with voiceover
  - Will be available on web site
  - Can track who has taken what classes
- Changing how Storm Data is entered
  - Will require employees to enter a confidence estimate
  - Will send employees a reminder to update their estimate

# Conclusions

## Summary of Findings

- WFOs perceive that they are underestimating the societal impacts of Storm Data events
- NWS employees are passionate, dedicated but don't believe they have sufficient training, information resources, or time
- Time is far less problematic than training and better access to resources
- NWS employees feel that there's a strong need for additional training and resources

## Results

- NWS making changes in response to our findings
- We will continue to work with performance branch to provide additional recommendations

# Questions?

Thank you!
